## Personal Statement

I've had a passion for math, science, and computers since childhood, continuing on through my graduate career, where I applied the ideas of phases of matter (as in, solid, liquid, gas,...) to the surprising context of quantum computing. More recently this drive has led me to machine learning, where I'm focused on using tools from theoretical physics, complexity theory, and higher mathematics to better make sense of deep learning models. I work well on teams, love sharing my interests with others, and produce surprising insights often.

## Highlights

- ✓ Powerful analytical tool kit drawing from diverse range of disciplines
- ✓ Top student in physics PhD cohort
- ✓ Strong research career with good publication record
- ✓ Clear and effective communicator
- ✓ Genuinely nice person, good with individual and team projects
- ✓ Decently fluent in Mandarin, too!

## (Formal) Education

MS & PhD in Physics, University of New Mexico, 2011 - 2017  
*Graduate dissertation, "Measurement-based quantum computation and symmetry-protected topological order" was top physics thesis of 2014-2017 (see Distinctions)*  
BS in Engineering w/ Physics, Olin College of Engineering, 2007 - 2011  
*Received four year full tuition F.W. Olin Scholarship*

## Research & Work Experience

Graduate research in quantum computation, Univ. of N.M., 2013 - 2017

- Used tensor toolbox and diverse software simulations to characterize computational behavior of quantum systems in terms of distinct phases of matter
- Developed non-traditional blend of analytical and numerical techniques to prove unexpected applications of different (quantum) computer architectures

Quantum foundations research, Perimeter Institute, Summer 2010  
*Studied non-classical logics and semantics of general probabilistic models*

Quantum matter simulation, Wellesley College, Summer 2009  
*Built MATLAB simulator for probing evolution of interacting Bose-Einstein condensates*

Renewable energy internship, All Earth Renewables, Summer 2007 & 2008  
*Developed software for solar tracking and fitting circuit models from diagnostic data*

## Publications & Projects

J. Miller and A. Miyake, "Latent computational complexity of symmetry-protected topological order with fractional symmetry", Physical Review Letters 120, 170503 (2018)

- Using simplified model of 2D quantum states, gave evidence for the existence of a phase of computationally universal quantum matter
- Proof utilized self-taught techniques from homological algebra, along with optimized numerical search in space of rank-3 tensors encoding states

J. Miller, S. Sanders, and A. Miyake, "Quantum supremacy in constant-time MQC: A unified architecture for sampling and verification", Physical Review A 96, 062320 (2017)

- Laid out new architecture for sampling from provably quantum probability distribution
- Discovered several unexpected improvements arising from surprising insights into computational complexity theory and statistical analysis

J. Miller and A. Miyake, "Hierarchy of universal entanglement in 2D measurement-based quantum computation", npj Quantum Information 2, 16036 (2016)

- Discovered surprising variant of classic quantum computing protocol which has interesting connection with novel phases of quantum matter
- Crucial part of protocol involved numerical simulation of novel percolation problem

J. Miller and A. Miyake, "Resource quality of a symmetry-protected topologically ordered phase for quantum computation", Physical Review Letters 114, 120506 (2015)

- Used analytic characterization of tensors to prove an entire phase of matter can be uniformly utilized for certain quantum computing tasks

J. Miller, "The Adumbrant Notational System", Humanities Capstone Project (2011)

- Studied lexicographically-derived "allowances" in existing mathematical notation, and how a hypothetical notational system using Chinese ideograms as variables might work

↖ This project was especially cool!
